**ART associated with limited epigenetic variation that disappear by Adulthood**

**“Should we be worried about IVF treatment?”**

**Introduction:** More than 7 million individuals have been conceived by Assisted Reproductive Technologies (ART) and there is some evidence that ART might be associated with rare imprinting disorders in early life outcomes. The periconception period and early embryogenesis are associated with widespread epigenetic remodelling, which can be influenced by ART, with effects on the developmental trajectory in utero, and potentially on health throughout life.

**Summary:** To investigate whether DNA methylation levels in blood differ between ART-conceived individuals relative to non-ART conceived individuals, Novakovic B et al. analysed epigenome-wide methylation data in neonatal (Guthrie spot) and adult peripheral whole blood using the EPIC array. DNA methylation status was generated for 149 neonatal and 158 adult ART-conceived individuals and for 58 neonatal and 75 adult non-ART conceived individuals. They profiled genome-wide DNA methylation in blood collected in the newborn period and in adulthood (age 22–35 years) from a unique longitudinal cohort of ART-conceived individuals, previously shown to have no differences in health outcomes in early adulthood compared with non-ART-conceived individuals. It showed evidence for specific ART-associated variation in methylation around birth, most of which occurred independently of embryo culturing. **ART-associated differential methylation at birth is largely attenuated in adulthood.** An interesting observation is that the CHRNE DMR at birth in both cohorts, was present in both IVF (with embryo culturing) and those who underwent IUI and GIFT procedures in the absence of culturing. This implies an effect of the ovarian stimulation or subfertility itself, rather than any of the additional embryo culturing processes associated with IVF. A similar direct effect of ovarian stimulation on offspring epigenetic profile have been reported for maternally imprinted regions and for LINE 1 methylation, which was decreased in association with high-dose hormone treatment.

**Conclusion:** ART conception is associated with limited epigenetic variation at birth that largely resolves by adulthood. The epigenetic variation may be associated in part with ovarian stimulation, or infertility per se. Additional studies of larger sample size in both animal models and humans are required in order to replicate our findings. Even if the transient epigenetic changes associated with ART are replicated, the potential health implications should not be over-interpreted given the absence of any direct evidence for downstream functional consequences of the observed epigenetic change, and the lack of compelling evidence for altered health outcomes in adulthood.

15th Annual Congress of Indian Fertility Society

FERTIVISION 2019
6-8 December
The Leela Ambience Hotel, Gurugram, New Delhi, NCR | India

THE BIGGEST ACADEMIC EVENT OF FERTILITY IN INDIA AT NEW DELHI

International Faculty

Dr. Arne Sunde
Norway

Dr. Ashok Agarwal
USA

Dr. C Balaji
Singapore

Dr. Edgar Mocanu
Ireland

Dr. Ephra Yasmin
UK

Dr. Gaid Lavy
USA

Dr. Gahor Vajta
Australia

Dr. Richard Kennedy
UK

Dr. Sandra Bateman
UK

Dr. Yadava Jeve

More Than 350 National Faculties

Limited Seats

Choose from 10 Pre Conference Workshops | 6 December

1) IFSS Workshop on ECO's and Donors in Ovarian Stimulation (900 - 1700)
2) Reproductive Surgery (900 - 1700)
3) Ultrasoundography Imaging In Infertility (900 - 1700)
4) Andrology & Semenology (900 - 1700)
5) Ovum Pickup and Embryo Transfer With Simulators (900 - 1700)
6) Cryobiology (900 - 1700)
7) Total Quality Management (900 - 1700)
8) Counseling and Holistic Medicine (900 - 1300)
9) Publish or Perish (900 - 1300)
10) IGT and Geriatrics (900 - 1700)
